AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A device for dabbling in water, comprising:

a body section having a support frame which possesses a configuration of a ring so that a user can freely pass through the ring;

a first floating section having a plurality of first rods which are secured to the support frame to be spaced apart, one from another, by a predetermined angle in a circumferential direction and extend downward from the support frame, a plurality of second rods which are respectively coupled to the first rods, and a plurality of first floating parts which are respectively provided to at the lower ends of the second rods to float the supporting frame and a user; and

a second floating section having a plurality of wires which are connected at their one ends end thereof to the support frame, and a pair of second floating parts which are connected to the other ends of the wiresadapted to be worn on the feet of the user- and connected to the other ends of the wires.

wherein a first ring is fastened at a predetermined position to an inside surface of the support frame to radially project toward a center of the support frame so that one end of the wires are tied to the first ring; and a chair is secured to the inside surface of the support frame opposite the first ring.

- 2. (Canceled)
- 3. (Original) The device as set forth in claim 1, wherein the first rods extend downward in such a way as to be diverged outward of the support frame and are defined at lower

Docket No.: 3427-0135PUS1

ends thereof with coupling holes; and the second rods are formed at upper ends thereof with coupling pins which are to be respectively inserted into the coupling holes.

- 4. (Original) The device as set forth in claim 3, wherein the first rods are formed in the coupling holes with internal threads; and the coupling pins of the second rods are formed on outer surfaces thereof with external threads.
- 5. (Original) The device as set forth in claim 1, wherein each second floating part comprises a bracket which is rotatably affixed to a lower end of the second rod and has substantially a 180°-rotated U-shaped configuration, and a floating wheel which is rotatably mounted to both legs of the bracket by a hinge and has a hollow sectional shape to be floated on the surface of the water.
 - 6. (Canceled)
 - 7. (New) A device for dabbling in water, comprising:

a body section having a support frame which possesses a configuration of a ring so that a user can freely pass through the ring;

a first floating section having a plurality of first rods which are secured to the support frame to be spaced apart, one from another, by a predetermined angle in a circumferential direction and extend downward from the support frame, a plurality of second rods which are

Amendment dated July 31, 2006 Reply to Office Action of March 30, 2006

respectively coupled to the first rods, and a plurality of first floating parts which are respectively

provided at the lower ends of the second rods to float the supporting frame and a user;

a second floating section having a plurality of wires which are connected at their one end

thereof to the support frame, and a pair of second floating parts adapted to be worn on the feet of

the user and connected to the other ends of the wires,

wherein each second floating part comprises a floating tube to which at least one of the

other ends of the wires is connected and which has a hollow sectional shape, and an overshoe

which is integrally formed on an upper surface of the floating tube; and wherein a second ring is

fastened to one end of the floating tube so that at least one of the other ends of the wires is tied to

the second ring.
